Dear Sir/Madam,

Congratulations on your moves to tighten and broaden GHG emissions. Thank you.
I have several points to raise of high concern.
I am a Medical Doctor working hard in recent times to reduce emissions from The Healthcare sector. I hope The EPA can bring about strict regulation that is comprehensive and covers all industries, despite any deemed 'duplication' or 'overregulation', and reduce the future burden of climate induced illness on our health sector..

I suggest some regulation of GHG from the Healthcare sector ie Nitrous Oxide which is squandered from hospital pipelines, as fugitive emissions, with no enforced oversight whatsoever. It is a potent GHG and the major Ozone depleting gas presently.
Also other extremely potent volatileagents/gases ie. Anaesthetic agents like 'Desflurane' which is of no medical benefit and is readily replaceable with less damaging agents (note - this is tabled for EU wide ban in ~2023 or so).

We should strictly be regulating METHANE fugitive emissions ie from coal mines.

Can we regulate/ban vehicle IDLING ie at public spaces, outside schools, in fact anywhere - the research is clear how damaging it is to health. Costing our healthcare dearly.
GAS CONNECTIONS I believe should be banned from all new residential developments and new housing estates, and some industry also. Domestic gas use is horrendous for health especially children and likely is costing our healthcare system billions of dollars per year.

Pollution OFFSETS are very difficult to be sure are useful, are open to abuse, can they be left out of assessments ??

WOOD WASTE for energy - this is corrupt and inexcusable, please regulate it out.

I have great reservations about waste to energy also (ie domestic or medical waste - WHO have also raised concerns regarding this globally) .

Can Wood burning stoves be regulated - they are a cause of extremely harmful pollutants, and also more significant GHG.

Many Thanks again for your plans to improve the regulation of GHG's.

Dr Anthony Hull
