Because time is running out that it can't be ignored. According to Glasgow Climate Action Summit https://www.venturecrowd.com.au/s/invest/ventures/wave-swell-energy . That will for you come with terms to an agreement for a net-zero. The sooner the better. Please read my important submission that is an issue for the environment I've sent you a previous submission that we must move away from coal to renewable.
It is a matter which requires a long-term solution to save our planet. It is inappropriate that powerful industrialists are thinking too much about their own interests and it shows how short-sighted they can be.

We all need to be educated about the facts of this issue. The world will be a better place for us all, in the long term to take an interest in the environment and promote the importance of our planet.

The Government needs to plan alternative measures to offset the unemployment resulting from coal-mine closures.
The Kyoto Protocol has helped us come to terms with and consider the importance of our planet. I feel that there are alternative ways to provide employees with greener, more sustainable industries.

The increase in the amount of ultraviolet sun glare and sea-level rise, plus the increase in bushfires, floods, and catastrophic storms are known to be the result of humans.

Politicians and industrialists plus Business managers need to use common sense and come to terms with the need for activities sustainability practices.
Now that climate change is known to be caused by human activities. Over the years activities such as transport emissions and burning coal have harmed the environment. Especially the recent summer 2019 to 2020 catastrophic bushfires.

x We just had the recent floods situation from the torrential rain in early March 2022. Very devastating. That occurred NSW North Coast to Queensland around Brisbane and Sydney's western area. Now a lot are homeless and have to relocate their properties. It just shows

We need to live in harmony within the environment. We have to move forward instead of going backward, to help benefit the environment. It is time to wake up.

It is good now that China is getting its act together to reduce their emission. They are one of the big polluters that are having a serious impact. It is choking the air in Beijing and Shanghai. It is serious. Now it is good that they coming to terms to replace clean renewable energy. It is progressing. I am thankful.

We have to be more sustainable, especially for the forthcoming generation that needs a better future, especially There is no denial of this and it can't be ignored. We need to accept vehicles that operate on electric power are the way to go.

It is a disgrace that Australia and China are some of the biggest polluters in the world. Although most the other nations are now switching to clean renewable energy. It helps move forward. I would appreciate now that Anthony.Albanesa PM also with US President (Mr Joe Biden) and the new British PM as well to work with other nations in the world to plan to save our planet.

According to what I've heard on the current affairs I am deeply disappointed that they say China is still building 95 coal-fired power stations going backwards. I thought they were doing alright to switch over to Clean Renewable.

That's how we need to encourage them to move forward. It shows that they rely on Australian coal to be exported to China. It's them trying to make big business I'd like to see plans for clean renewable energy which is healthy for the environment and be assured it will save money in the long term. That's the way it makes sense that way.

We just can't afford to destroy the planet which is what a lot of industries are doing by encouraging more emissions. I believe we must clean up our practice, and combat global warming especially to help the forthcoming generations.
I put in my submission in 2014 concerning coal seam gas and land clearing to Australia former PM Tony Abbott, a submission of concern to save our planet.
I am involved personally in conservation projects such as bush regeneration and sustainable programs plus recycling. I feel very strongly about our bushland, which

I love, and clean renewable energy. We don't have planet B.
I look forward to your response. Please notify me what action will be taken to handle this.
Yours Sincerely,
Paul Vonwiller🙏

Getting the future RIGHT means every policy and investment is:

✓ Climate and nature positive, setting a clear pathway for Australia to move to net-zero climate pollution and regenerate the natural environments we depend on.

✓ Makes us all healthier and more resilient, increasing the capacity of people across Australia, of wildlife and nature, of essential services and built and natural infrastructure to respond and recover from future extreme events like bushfires and pandemics.

✓ Makes Australia fairer, strengthening citizens' participation and trust in democracy, increasing equality, reliable jobs and protecting communities most vulnerable to climate change and extreme weather.

We need a plan that:

✓ Recovers (between now and October): creates immediate-term jobs that are good for climate and nature

✓ Rebuilds (between October and May 2021) restores the health and resilience of communities, forests, rivers, parks and wetlands & sets the frameworks for long last climate positive job creation

✓ Renews (between June 2021 and May 2022): works to make Australia a renewable energy superpower
